Log Findings using Splunk:

I Ingested Proxy log, Authentication log, Firewall log dataset into Splunk to identify anomalies and the findings are shown below.

Figure 7: image showing users who visited the website

The result of the Proxy log ingested into Splunk shows that two user(Bob and Alice) already visited the website,

Visiting the website 'sign.in' implies that credentials has been submitted, and this calls for immediate action.

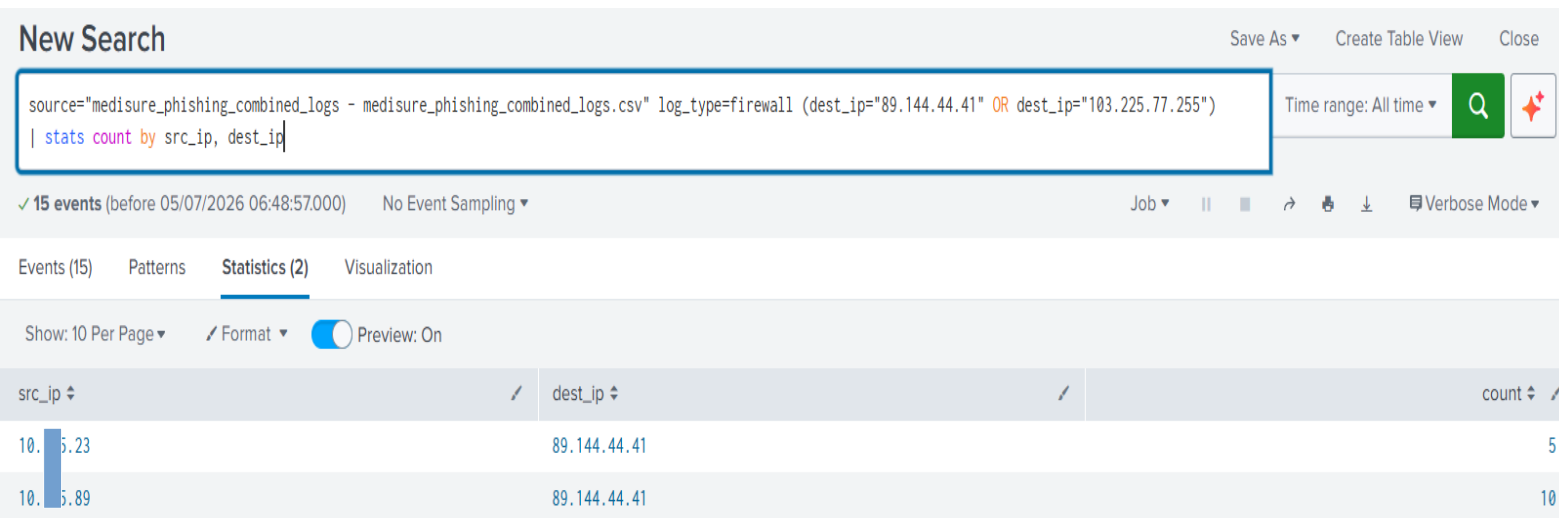

Figure8 : image showing firewall log.

The result above from firewall reconfirmed that Alice and Bob interacted with the malicious link multiple times, this a call for concern.

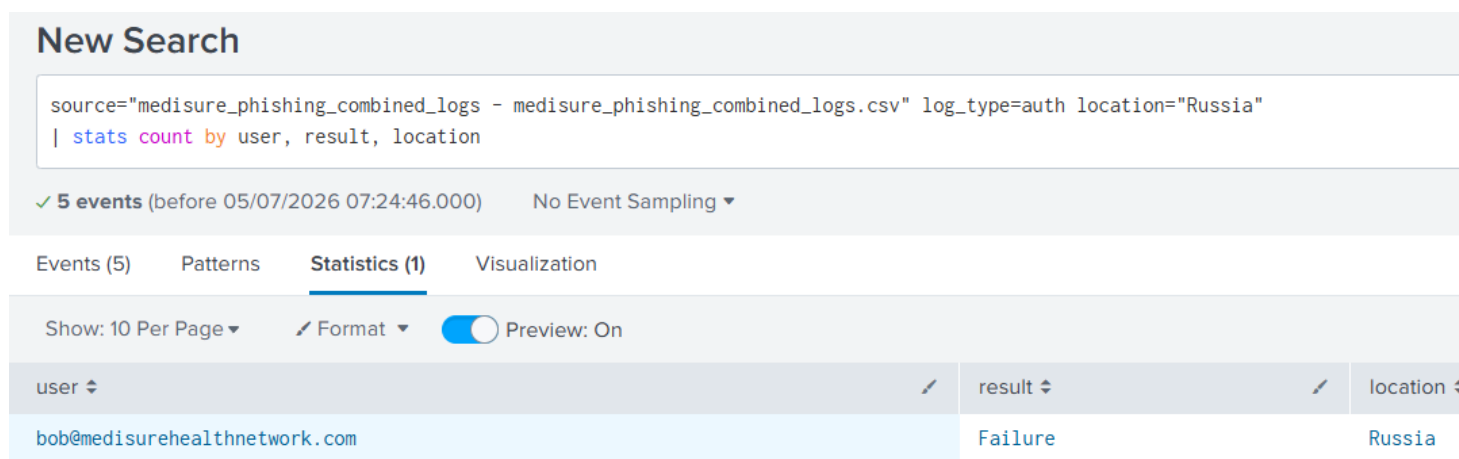

Figure9 : image showing the user that connected to the attacker infrastructure.

The output shows that Bob's system has been compromised, as the attacker is already trying to login from Russia using Bob's account.

Bob's computer was quarantined immediately.
